VELOCITY

Top Post This Week — Implementation Guide

April 2026

Data Confirmed from Graph API Explorer

Field	Value	Source
Post ID	17958788559103281	media API
Caption	More Jobs. More Income. Join Wefix...	media API ■
Media URL	https://scontent.cdninstagram.com/...	media API ■
Media Type	IMAGE	media API ■
Like Count	2	media API ■
Comments Count	2	media API ■
Views (Impressions)	110	post insights ■
Reach	56	post insights ■
Saved	0	post insights ■

STEP 1 — Fetch All Posts with Image + Caption

API Call:

```
https://graph.facebook.com/v25.0/17841473581813349/media?fields=id,caption,media_url,thumbnail_url,media_type,like_count,comments_count,timestamp&limit;=10&access;_token=YOUR_TOKEN
```

What you get back:

- ■ **id — post ID (needed for Step 2)**
- ■ **caption — post text to display**
- ■ **media_url — image to show in card**
- ■ **like_count — number of likes**
- ■ **comments_count — number of comments**
- ■ **timestamp — to filter posts from this week only**

STEP 2 — Fetch Views, Reach, Saved Per Post

For each post ID from Step 1, call:

```
https://graph.facebook.com/v25.0/{POST_ID}/insights?metric=views,reach,saved.=lifetime&access;_token=YOUR_TOKEN
```

Replace {POST_ID} with: 17958788559103281

What you get back:

- ■ **views = 110 — total times post was displayed**
- ■ **reach = 56 — unique accounts who saw the post**
- ■ **saved = 0 — times post was saved**

STEP 3 — Score Each Post to Find the Top One

Scoring Formula:

```
score = (reach x 3) + (views x 2) + (likes x 1.5) + (saves x 2)
```

Why these weights?

Metric	Weight	Reason
Reach	x 3	Most important — unique people who saw the post
Views	x 2	Total impressions — shows visibility
Saves	x 2	High intent action — user found it valuable
Likes	x 1.5	Engagement signal
Comments	x 1	Engagement but lower weight

Calculation with your current post:

```
score = (56 x 3) + (110 x 2) + (2 x 1.5) + (0 x 2)
score = 168 + 220 + 3 + 0
score = 391 <-- This post is your Top Post
```

STEP 4 — Calculate Engagement Rate for Top Post

Formula:

```
Engagement Rate = (likes + comments + saves) / reach x 100
```

With your data:

```
= (2 + 2 + 0) / 56 x 100
= 4 / 56 x 100
= 7.1%
```

STEP 5 — Display in Top Post Card

Card Field	Data Source	Value
Post Image	media_url from Step 1	scontent.cdninstagram.com/...
Caption	caption from Step 1	More Jobs. More Income...
Views	views from Step 2	110
Likes	like_count from Step 1	2
Engagement %	Calculated in Step 4	7.1%

JavaScript Code — Full Implementation

```
const IG_ID = '17841473581813349';
const TOKEN = 'your_access_token';
const BASE = 'https://graph.facebook.com/v25.0';

// STEP 1: Get all posts
const mediaRes = await fetch(
`${BASE}/${IG_ID}/media?fields=id,caption,media_url,
```

```
media_type,like_count,comments_count,timestamp
&limit;=10&access;_token=${TOKEN}`);
const mediaData = await mediaRes.json();

// STEP 2: Get insights for each post
const postsWithInsights = await Promise.all(
mediaData.data.map(async (post) => {
const ins = await fetch(`${BASE}/${post.id}/insights
?metric=views,reach,saved.=lifetime
&access;_token=${TOKEN}`);
const insData = await ins.json();
const views = insData.data[0].values[0].value;
const reach = insData.data[1].values[0].value;
const saved = insData.data[2].values[0].value;
return { ...post, views, reach, saved };
})
);

// STEP 3: Score and find top post
const scored = postsWithInsights.map(p => ({
...p,
score: (p.reach*3)+(p.views*2)+(p.like_count*1.5)+(p.saved*2)
}));
const topPost = scored.sort((a,b) => b.score - a.score)[0];

// STEP 4: Calculate engagement rate
const engRate = ((topPost.like_count + topPost.comments_count
+ topPost.saved) / topPost.reach * 100).toFixed(1);

// STEP 5: Display
console.log({
image: topPost.media_url,
caption: topPost.caption,
views: topPost.views, // 110
likes: topPost.like_count, // 2
engagement: engRate + '%' // 7.1%
});
```

Important Notes

1. For IMAGE posts, use media_url as the thumbnail. thumbnail_url is only for VIDEO posts.
2. comments_count from /media endpoint may differ slightly from /insights. Use /media value.
3. As you post more content, the scoring formula will automatically pick the best performing post.
4. The access token expires in ~1 hour. Store it securely and refresh before making API calls.
5. Filter posts by timestamp to only score posts from the current week for 'Top Post This Week'.
